Sessie Preventative and Curative Lake Management in Controlling Eutrophication

Though the planet we inhabit is called Earth, what makes the third planet of our solar system unique is water. Most of this water (97.5 %), however, is saline, not directly available for human life. Only negligible amount of freshwater occurs in form of rivers, lakes or groundwater aquifers, systems that represent the main water source for all human well-being.

These ecosystems are continually threatened by various sources of anthropogenic pollution, water abstraction, and by climate changes which influence primarily the global
